Technical Databook

2011 · 2012

Car and Van Tyres

Barum

This data book contains comprehensive information on Barum Car and Van Tyres. The technical data and other details on tyres and accessories have been compiled to reflect as exactly and completely as possible the current state of development and are based on **ETRTO**[1], **ISO**[2] and **WdK/DIN**[3] standards.

Most of the Barum tyres comply with **DOT**[4] regulations and are marked accordingly.

They are homologated in accordance with the relevant **ECE**[5] regulation and are hence also homologated in accordance with current **EU**[6] tyre regulation.

This databook is intended for information and instruction only. No liability whatsoever will be accepted for damage, regardless of its nature and its legal basis, arising from advice given in this book.

1) ETRTO – The European Tyre and Rim Technical Organisation, Brussels
2) ISO – International Organization for Standardization
3) DIN – German Institute for Standardization, Berlin
WdK – German Rubber Manufacturers' Association, Frankfurt/M.
4) DOT – Department of Transportation (USA)
5) ECE – Economic Commission for Europe (UNO-Institution, Geneva)
6) EU – European Union, formerly EEC

Tyre safety tips

We recommend that the **inflation pressure** of every tyre is **checked** at least **every 14 days.** Avoid driving over sharp-edged or pointed objects.

Lower inflation pressures, greater loads or higher speeds than specified by the vehicle and/or tyre manufacturer all shorten the **service life** of tyres and can result in structural damages.

We recommend that **new tyres** are **run in** at moderate speeds for the first 120 to 190 miles (200 to 300 km) to roughen the tread surface. The tyre does not achieve its best performance until after this running-in period.

We recommend all wheel positions of a passenger car are fitted with tyres of the **same tread design.**

Please observe the detailed operating instructions on page 41 ff.

SAFETY WARNING!

The instructions given in this databook must be observed to ensure vehicle safety at all times. This applies especially with respect to tyre inflation pressure recommendations.

Non-compliance with these instructions means risking tyre damage which, if serious enough, may result in a tyre bursting. It is hazards like these that can cause traffic accidents involving vehicle damage and/or serious personal injury.

7

① **225/40 ZR18 92W**

225 Nominal Section width in mm.

40 Nominal aspect ratio
(Tyre height is 40 % of tyre width).

R Symbol for radial tyre.

18 Rim diameter Code (in inches).

92 Load Index "92" = max. load of this tyre is 630 kg
(see table page 6).

W Speed Index, indicating max. speed
W = 270 km/h / 169 mph (see table page 6).

② **EXTRA LOAD (XL)** or **„REINFORCED"**
for reinforced tyres,
„M+S" for winter tyres.

Snowflake on the mountain (in USA and Canada):
This additional marking on an M + S tyre shows
that the tyre meets prescribed test criteria
and ensures good winter properties.

③ **TUBELESS** tubeless.
(TUBE TYPE tyres must be mounted with tubes).

④ **1511** Production code ("15" means 15 th week,
"11" means 2011).

⑤ **E 4** Marking indicating accordance with ECE regulations. The number after the E in the circle indicates the country of homologation.
Ⓔ4 (4 = Netherlands) *

0222088 Approval number acc. to relevant ECE regulation

⑥ **TWI** Sign for position of TWI (Tread Wear Indicator).
Cross ribs evenly spaced around the circumference of the tyre in the longitudinal tread grooves and becoming level with the tread surface when the remaining tread depth is down to 1.6 mm.

⑦ **Made in ...** Marking showing the country of origin.

All other information applies to countries outside Europe (esp. USA).

*) This sign may also be e4,
if the tyre was homologated in accordance
with the EU guideline 92/23.

Including Load Index and Speed Index

Load Index (LI)

The Load Index is a numerical code associated with the maximum load a tyre can carry (see also p. 47).

LI	kg	LI	kg	LI	kg	LI	kg	LI	kg
50	190	65	290	80	450	95	690	110	1060
51	195	66	300	81	462	96	710	111	1090
52	200	67	307	82	475	97	730	112	1120
53	206	68	315	83	487	98	750	113	1150
54	212	69	325	84	500	99	775	114	1180
55	218	70	335	85	515	100	800	115	1215
56	224	71	345	86	530	101	825	116	1250
57	230	72	355	87	545	102	850	117	1285
58	236	73	365	88	560	103	875	118	1320

62	265	77	412	92	630	107	975	122	1500
63	272	78	425	93	650	108	1000	123	1550
64	280	79	437	94	670	109	1030	124	1600

Speed Index (SI)

The Speed Index indicates the maximum speed at which the tyre can carry a load corresponding to its Load Index.

SI	Max. speed for **passenger car tyres**	
M	81 mph [1)]	130 km/h [1)]
P	93 mph	150 km/h
Q	100 mph	160 km/h
R	106 mph	170 km/h
S	112 mph	180 km/h
T	118 mph	190 km/h
H	130 mph	210 km/h
V	150 mph	240 km/h
W	169 mph	270 km/h
Y	187 mph	300 km/h
ZR	over 150 mph	over 240 km/h

SI	Reference speed for **commercial vehicle tyres**	
K	69 mph	110 km/h
L	75 mph	120 km/h
M	81 mph	130 km/h
N	87 mph	140 km/h
P	93 mph	150 km/h
Q	100 mph	160 km/h
R	106 mph	170 km/h
S	112 mph	180 km/h
T	118 mph	190 km/h
H	130 mph	210 km/h

[1)] As a rule only used for special spare tyres if they qualify according to ECE Regulation 30. In accordance with ECE Regulation 64 governing the use of special spare tyres, even these more highly rated tyres may only be used up to a maximum speed of 50 mph (80 km/h).

The technical data in the tables comply generally with international standards.

All **dimensions** in the tables of this databook are given in millimetres (mm), if not indicated in a different way.

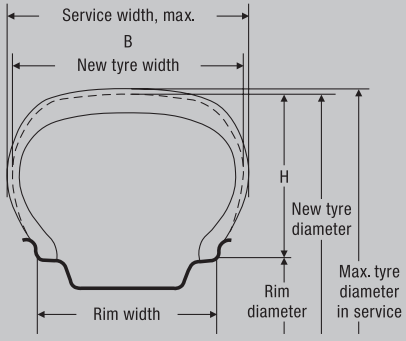
The **rim diameter** is given in inch code. Tyre ranges on new rim types may also be marked in mm.

Construction measurements are theoretical values for the design of the tyre: The **width** is relative to the smooth sidewall, the **outer diameter** to the tread centre.

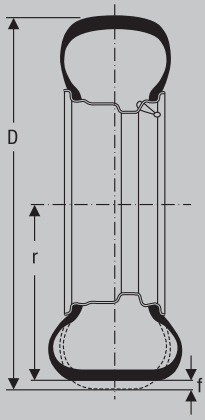
Maximum measurements are actual **operating measurements** of the inflated tyre (operating pressure) in the unloaded state. They include growth but exclude dynamic distortions.

The **width** is the max. permitted tyre width, including sidewall decorative markings, when the tyre is mounted on the correct rim.

The **outer diameter** is the max. permitted diameter. The max. measurements are binding for **vehicle designers.**



(Standard rim for B and new tyre diameter)



D = Outer diameter of the tyre
r = Static radius
f = Deflection under load

The **static radius** is the distance between the wheel centre and the ground contact patch under max. load at the recommended tyre pressure.

The **rolling circumference** is the distance covered by a point on the circumference when the tyre revolves once at 60 km/h (37 mph).

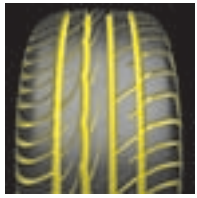
The **load capacity** in kilograms (kg) is weight in the sense of a mass.

Tyre pressure (inflation pressure) is given in bar as an overpressure (cold tyre), for driving speeds **up to 160 km/h (100 mph).**

Vehicle designers should bear in mind the **maximum values** for tyre outer diameter and width when planning the **wheel space of a vehicle,** if all standard approved tyres are to fit without any restrictions. Should this by way of exception not be possible, the safety risk must be eliminated by taking appropriate measures.

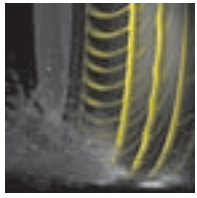
The economical high performer

The Bravuris 2 – so much driving pleasure for so little money! Barum's fastest all-rounder for long-lasting fun.



- Innovative asymmetrical tread pattern.
- Higher mileage performance – through computer-optimised contour and the latest silica compound.
- Even pressure distribution for reduced wear.

- Large tread lugs on the tyre outer side ensure handling stability and safe braking on dry roads.
- Siped ribs provide optimum steering precision – even at high speed.
- Max. traction and outstanding braking power through sturdy lugs.



- Large number of lugs on the tyre inner side reduce the risk of aquaplaning and provide safety when braking in the wet.
- Wide grooves disperse water quickly and efficiently.
- New silica compound means best grip on wet roads.

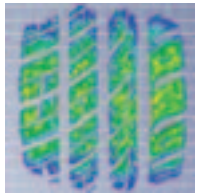
Makes driving and saving fun

The Brillantis 2 provides the perfect combination of economy and long service life. Balanced driving characteristics and a precise steering response make this tyre a good all-round solution.

- Flat contour, good ground pressure distribution.
- High milage performance for prolonged driving fun.
- Pleasantly low rolling noise.



- Asymmetrical tread pattern with solid outer shoulder.
- Substantial lateral stiffness in the outer shoulder lugs.
- Greater safety during critical steering manoeuvres.

- Continuous lateral grooves on the inner side, narrow sipes in the lugs.
- Unimpeded water flow, increased aquaplaning safety.
- Short braking distances on wet roads.

Claws firmly in the snow.

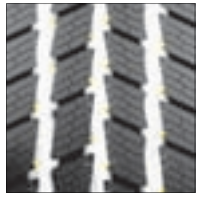
The new Polaris 3 has a good grip in snow. It adapts perfectly to winter conditions, and thanks to its low wear and reduced fuel consumption, it is the ideal winter tyre for economical drivers.

Mileage performance

- Sipes of different depths at an angle to the lug edge.
- High mileage performance by low wear.
- Increased cost-efficiency.

Braking in snow

- ‘Snow catcher’ stops the snow from slipping through the groove.
- Optimised setting-off on snowy roads.
- Offers controlled braking.



Rolling resistance

- Additional groove in the shoulder lugs.
- Low rolling resistance.
- Reduced fuel consumption.

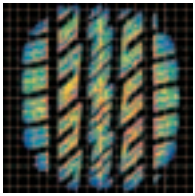
For active drivers counting on fun

The optimum blend of safety, activity, long service life and attractive price offered by the Bravuris 4x4 makes this tyre an impressive choice. Ideally suited for driving on the road and for light off-road conditions.

- Extra flat contour, uniform stiffness.
- Positive interlocking with the road surface.
- Safe braking in both wet and dry conditions.

- Reduced slip, even ground pressure distribution.
- Very low tread wear.
- High mileage performance for prolonged driving pleasure.



- Optimised sipes level off peaks in noise.
- High driving comfort, low tyre noise.
- Outstanding price / performance ratio.

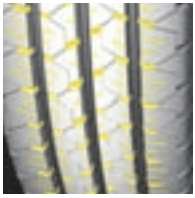
A sound deal – the economical all-rounder

The Vanis – good handling and excellent driving performance in the wet are this tyre's outstanding features.

- Good traction at lower loads, thanks to supple sipes.
- Firm grip under dynamic loads through fine angled grooves.
- Reliable grip in all directions, thanks to multi-edged lugged ribs.



- Even wear through flat belt contour.
- Sturdy tread lug structure ensures a long tyre life.
- Tread lugs vary in length, thereby reducing noise levels.

- Wide, circumferential grooves channel water out of the tread.
- Optimised tread pattern reduces the risk of aquaplaning.
- New tread compound ensures high mileage performance.

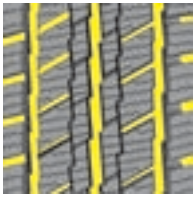
Very safe driving.
Very good savings.

The SnoVanis combines safe driving characteristics, high mileage performance and low price. Plus optimum ground contact. A tyre for MPVs and light vans – even in the toughest applications on snow-covered roads.

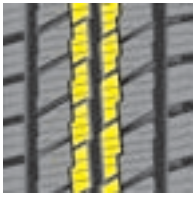
Grooves and sipes

- Perfect traction thanks to high number of sipes.
- Lateral grooves disperse water efficiently.
- For more fun at the wheel while keeping a safe grip on the road.



Tread ribs

- Offset arrangement of central ribs.
- Provide counter-support.
- Increase driving stability.



Contour

- Flat contour through flat tyre belt.
- Reduces deformation and slip.
- Minimises wear – for a long service life.

*) 14, 15 and small 16 inch C tyres with treads like pass.car tyres for service on delivery vans.

) also for C tyres: Load capacity **per tyre (single fitment)

Conditions of use:

An increase of 10 % resp. 5 % for C tyres over the load capacity, as quoted in these tables, is permitted when tyres are fitted to caravans and light trailers with a maximum operating speed up to 100 km/h (62 mph). The basic inflation pressure should be increased by 0.2 bar, as quoted in these tables.

The rim is the part of the wheel which supports the tyre.

1. Important elements of the rim

Rim flange = lateral support for the tyre bead

Flange distance = clear rim width

Bead seat = base on which the tyre bead is seated

Well = inner side of the rim

Diameter = specified diameter flange/bead seat

Hump = continuous raised section of the rim bead seat which enables a better fitting of tubeless tyre beads at **low pressure.***)

2. Types of rims

The well-base rim is virtually the only type of rim used on cars, caravans and other car trailers:

Well-base rims = one-piece rims, deepened well for easier tyre fitting, 5° tapered bead seat, "x" in the wheel size designation.

Virtually only J and B versions of the well-base rim are used and these are explained here in more detail.

If rubber valves (snap-in type) are used on rims for higher speeds, these must be fitted with **valve supports** where necessary. Also refer to the section "Fitting the tyre".

3. Wheel disc (nave)

The wheel disc is the linking element between the rim and the axle hub. Of all the measurements for wheel linking elements – centre bore and bore diameter, bolt hole type and **offset depth** – the latter is a particularly important factor for the free movement of the tyre in any wheel position.

(Offset depth = 0, when the rim centre and hub contact area of the wheel disc are in line).

4. Wheel strength

The wheel manufacturer must confirm that the wheel strength is adequate for each particular application.

5. Lateral and true running of the wheels (without tyres)

On cars which are virtually all able to considerably exceed 100 km/h (62 mph), it is particularly important that the wheels of the vehicle are **well-centred.**

There should be as little radial and lateral run-out as possible on both bead seat/flange sides of the rim, in order to achieve **good smooth running.**

The standard shows max. tolerances of 1.20 mm. This dimension is for the centre of the tyre seat area or the centre of the flange height. All measurements, particularly the **uniformity,** should be well within these tolerances.

*) Safety shoulders (e.g. hump) are prescribed for tubeless radial car tyres. They should also be used for tubeless truck C tyres with a 14, 15 or 16 code for the rim diameter.

R_4 and R_5: between 4 and 10 mm
R_5: not larger than 10 mm

Valve Hole-Ø:
11.5 mm ($11.3_{-0}^{+0.4}$) centrally in the side of the rim well.
16.0 mm ($15.7\ mm_{-0}^{+0.4}$) only with Ø-Code 15.

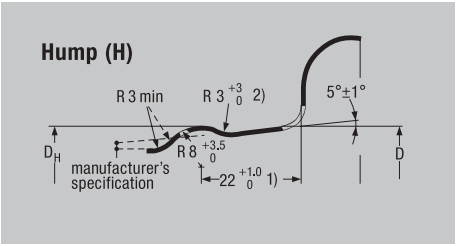
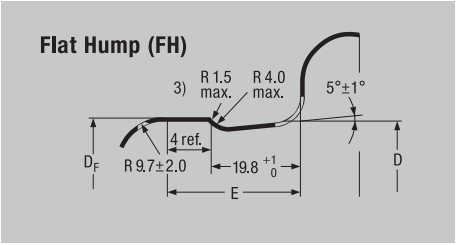
Special rim executions for passenger cars

In many countries **safety rims** must be used for tubeless radial tyres.





[1] In most car rims 19.8 mm.
[2] For B-Rims R = 8.5 mm max. resp. R = 4±1 mm.
[3] Deburred

These full-drop centre rims with safety shoulders for cars, estate cars and light trucks are marked with the following codes shown after rim size designation:

H = one-sided round hump on outer shoulder (formerly: H 1)

H 2 = double round hump

FH = flat hump on outer shoulder (formerly: FHA 1)

FH 2 = double flat hump (formerly: FHA 2)

CH = combination hump = flat hump on outer shoulder, round hump on inner shoulder (formerly: FHA-H)

SL = special ledge

EH 2 = Extended Hump (with extended hump on both sides)
(see following page)

SAFETY WARNING!

The following instructions must be observed to ensure vehicle safety at all times. Disregarding the fitting instructions could endanger the safety of the tyre fitter or driver. This applies in particular to inflation pressure. Non-compliance with these instructions means risking tyre damage which, if serious enough, may result in a tyre bursting. It is an hazard like this that can cause traffic accidents involving vehicle damage and/or serious personal injury.

Correct choice of tyre and wheel

Tyres can be properly maintained only if they are chosen in accordance with vehicle documents and recommendations of the tyre manufacturer. The use of **higher grade tyres** of the same size is permitted: Higher Speed Index, i.e. "H" instead of "T". Greater load capacity, i.e. Load Index 82 instead of 80. Both factors may be combined, i.e. greater load and speed.

If tyres are changed to a different size, all legal requirements and regulations, as well as the recommendations of the vehicle, wheel and tyre manufacturers must be complied with. In any event, the freedom of motion of the wheel and adequate load capacity of the tyre must be observed.

In some countries, tyre sizes and rims not entered in the vehicle registration document may only be fitted if the vehicle and tyre manufacturer issue a **certificate of non-objection** or if a public authority issues fitting approval after an inspection by an officially authorised expert *).

80 and 82 series passenger car tyres of the same size can be interchanged without new approval and without any new entry in the vehicle documents if LI and SI of the interchanging size are of an equivalent or higher-grade quality. Example: 155/80 R13 79 T replaces 155 R13 79 T.

Mixed tyre constructions for cars, caravans and other car trailers are not permitted: Tyres fitted on any one vehicle must all be either radial or cross-ply. (Exception: Use of the spare tyre in an emergency).

The same applies to the choice of **wheels (rims):** The standard wheels approved by the vehicle manufacturer must be used as recommended.

The **tyre widths** given in the tables on pages 15–27 and 30–33 refer to the **measuring rim** (bold print in the tables). In the event of a change in the rim width by +½ inch, the tyre width changes by approx. +5 mm.

Winter tyres

Winter tyres are clearly superior in the cold months of the year; they offer a wider margin of safety and better economy when the temperature drops below 7 °C.

Winter tyres approved for a max. speed lower than that of the vehicle may only be fitted if the max. speed of these tyres is displayed in full view of the driver, e. g. on a clearly visible sticker on the dashboard *). This maximum tyre speed must not be exceeded.

A combination of summer and winter tyres on passenger cars is not recommended. In most European countries either summer or winter (M + S) tyres are specified for any one axle; in some countries **) this applies to all four wheel positions.

Winter tyres have to meet special requirements, meaning that the legal minimum tread depth of 1.6 mm is inadequate. **The suitability limit for winter use is a tread depth of 4 mm.** In the interest of safety, Barum recommends replacing winter tyres before the tread depth drops below 4 mm for winter service. Such tyres can still be used in summer.

Top safety in winter can be provided only by true winter tyres on all axle positions (4 tyres).

Snowflake designation (in USA and Canada): This additional marking on an M + S tyre shows that the tyre meets prescribed test criteria and ensures good winter properties.

*) This does not apply to the UK.

**) Exception: In Austria, passenger car winter tyres with less than 4 mm remaining tread depth are no longer legally considered to be winter tyres.

Brittleness temperature of rubber compounds – passenger tyres

Several performance aspects of tyres are influenced by temperature. For example traction (wet and dry), rolling resistance, mileage and ride comfort.

To achieve optimum performance, Barum therefore recommends that winter tyres be used at temperatures below +7°C and summer tyres at temperatures above +7°C.

All-season tyres with M+S marking, although a compromise in certain performance aspects, are suitable for use in hot and cold temperatures.

The tread patterns and rubber compounds used in the above mentioned tyres are specifically designed and developed to offer optimum performance within the temperature range for which they are intended.

Summer tyres – especially Ultra High Performance tyres
The highly developed, specialized tread compounds used in such tyres are designed to provide the highest possible levels of grip at ambient temperatures above +7°C.

Such tread compounds are however **very sensitive to temperature.**

Permanent damage may occur to the tread compounds of such tyres if they are used at temperatures below –20°C.

At this temperature, the tread compounds of UHP summer tyres may lose their elasticity and become brittle (the so-called brittleness point). When this occurs and the tyre is flexed, the tread compound may crack.

Therefore, UHP summer tyres should not be used at temperatures below –20°C. Barum tyres with an M+S marking on the sidewall are suitable for use down to –45°C.

Fitting the tyre

SAFETY WARNING!

If a tyre is not properly fitted it may burst. The energy released in a blow-out can cause fatal injuries so tyres must be fitted by an expert.
Only approved fitting tools and lubricants may be used. Observe all fitting instructions.

Before the old tyre is taken off the valve insert must be unscrewed and removed to ensure all air has escaped.

The new tyre and rim must have matching diameters and be approved as a combination suitable for the vehicle model concerned. Only rims of the correct size in perfect condition and free of rust should be used. They must not be damaged, out of shape or worn.

When fitting new tube-type tyres, always use **new tubes**. As tubes stretch in service, there is a risk of folds forming in old tubes, so re-used tubes could suddenly tear.

For safety reasons, tubeless tyres should always be fitted with a **new valve.**

If rubber valves (snap-in types) are used for tubeless tyres, the vehicle manufacturer's instructions must be complied with in all cases.
A **valve support** (i.e. a stopper on the rim itself or the hubcap) should be fitted, if H, V, W, Y or ZR tyres are specified for the vehicle. This ensures that valves are not forced off at high speeds.

Always coat the tyre beads and the rim with a **fitting lubricant** recommended by the tyre manufacturer. Never use greases or other hydrocarbons for this purpose.

While the tyre is being inflated, the wheel must remain firmly secured on the mounting machine. **Never inflate an unsecured tyre.** If a loose tyre bursts, the wheel could be thrown around, causing damage.

Keep a reasonable distance from any tyre that is being inflated. Make use of a sufficiently long and secured extension hose with an integrated pressure gauge. **Never bend over a tyre while it is being inflated!**

When fitting tubeless car tyres, care should be taken to ensure that the tyre beads coming from the well-base first clear the hump in the rim shoulder. To avoid cracks in the bead core, the **"pop" pressure** necessary should not exceed 3.3 bar. If the tyre does not pop into place even at this pressure, the pressure must be lowered, and the cause identified and eliminated. Then the procedure can be repeated.

Only when the tyre beads are seated correctly on the rim shoulder may the pressure be increased to achieve the required press-fit and firm grip on the rim flanges. However, this **"fitting pressure"** should not exceed the max. pressure given in the tables by more than 50 % or be more than 4.0 bar. After this, adjust the pressure to the **operating pressure** specified by the vehicle manufacturer.

Car tyres should be **dynamically balanced** to achieve smooth running.

Fitting the wheel to the vehicle

Vehicle axle data such as toe-in, camber angle and wheel castor as well as axle alignment must be checked and, if necessary, be adjusted to within tolerances. Only then should new tyres be fitted.

When fitting a tyre, make sure that the wheel is centred on the axle hub. If necessary, re-balance the wheel electronically once it is fitted on the vehicle.

Valves should be fitted with **valve caps** – preferably with a sealing ring – as they protect the delicate **valve inserts** and the inside of the tyre.

When mounting **wheel caps and wheel trim rings,** sufficient clearance to the tyre sidewall must be maintained. The wheel cap or wheel trim ring may not come in contact with the tyre under any operating conditions (e. g. brutal braking maneuvers, fast cornering). The diameter of the wheel cap and the wheel trim ring may not extend beyond the rim flange edge. This applies in particular to tyres with rim protection (flange rib).

Directional tyres must be fitted so that they roll in the direction of the arrow on the sidewall as the vehicle moves forward.

Exception: For a short-term use as a temporary fitment spare; but revert to specified fitted position at the earliest possible opportunity!

Modern **asymmetrical tyres** are frequently non-directional. These tyres must be fitted with the sidewall 'Outside' on the outside of the vehicle so that their asymmetrical treads can be used to best effect.

Tyre pressure

SAFETY WARNING!

Incorrect tyre pressure can lead to the inside of the tyre being damaged. This can result in tyre problems or even a blow-out. Hidden tyre problems are not rectified by adjusting the tyre pressure.

Table 1:
Load capacities and tyre pressures – standard car tyres
(The tyre pressure values shown here apply to speeds up to 160 km/h (100 mph) for camber angles not greater than 2°)

101	615	635	660	685	710	735	755	780	800	**825**
102	630	655	680	705	730	755	780	805	825	**850**

The tyre must be inflated to the pressure specified by the vehicle and tyre manufacturer. This varies depending on the load and service conditions.

The pressure always refers to the **cold** tyre and must not be allowed to fall below this value. The pressure inside warm tyres – driving causes heat build-up – is naturally higher. So never reduce the pressure of warm tyres. Once they cool down, their pressure could fall below the specified **minimum tyre pressure.**

Tyre pressure must be checked and adjusted regularly every 14 days on the cold tyre. Don't forget the spare!

Incorrect tyre pressure causes premature and/or uneven tread wear. **Under-inflated** tyres have a higher **rolling resistance,** and this means a higher **fuel consumption.**

The tyre pressure values for car tyres given in table 1 and 2 are **minimum pressures** for speeds up to 160 km/h (100 mph). They may be increased, for example, for reasons of driving stability.

3.2 bar is the **maximum tyre pressure** on standard version car tyres up to and including Speed Index T; 3.5 bar for H-, V-, W-, Y- and ZR-, as well as M+S and XL/Reinforced tyres.

These values may not be exceeded to ensure that the structural performance of the tyres and rims is not impaired.

ZR tyres without operational code have from 160 km/h (100 mph) to 190 km/h (118 mph) inclusive the stated pressure of 2.5 bar. Then the inflation pressure must be increased by 0.1 bar for each 10 km/h (6 mph) up to 3.0 bar at 240 km/h (150 mph) under full load and maximum 2° wheel camber.

Table 3:
For **higher speeds** the **tyre pressure** should be **increased** in regard of the load capacity (see table 4, taken from the ETRTO Standards Manual):

Speed capacity of the vehicle (incl. tolerance, about 9 km/h, 6 mph) (km/h)	Speed Indices								
	Q	R	S	T	U	H	V	W	Y
	Tyre pressure* (bar)								
≤ 160	2.5	2.5	2.5	2.5	2.5	2.5	2.5	2.5	2.5
170		2.6	2.6	2.6	2.6	2.6	2.6	2.5	2.5
180			2.6	2.6	2.6	2.6	2.6	2.5	2.5
190				2.7	2.7	2.7	2.7	2.5	2.5
200					2.7	2.7	2.7	2.6	2.5
210						2.8	2.8	2.7	2.5

230							2.8	2.9	2.6
240							2.8	3.0	2.7
250								3.0	2.8
260								3.0	2.9
270								3.0	3.0
280									3.0
290									3.0
300									3.0

Load capacity and speed

When determining the minimum tyre size necessary for a vehicle, the permitted **axle load** and the **maximum design speed** of the vehicle must be used as a basis.

The maximum load capacity of a car tyre is expressed through its **Load Index (LI),** see page 6.

*at the maximum load of the tyre, up to 2° wheel camber

Table 4:
Percentage of load capacity (%) versus speed [1)]
(taken from the ETRTO Standards Manual)

Speed capacity of the vehicle (incl. tolerance, about 1% $V_{..}$ + 6.5 km/h) (km/h)	Speed Index (SI) H %	V %	W %	Y %
210	100	100	100	100
220	–	97	100	100
230	–	94	100	100
240	–	91	100	100
250	–	–	95	100
260	–	–	90	100
270	–	–	85	100
280	–	–	–	95
290	–	–	–	90
300 [2)]	–	–	–	85

[1)] For intermediate maximum speeds, linear interpolation of the tyre load capacity is permitted.

[2)] For speeds over 300 km/h (187 mph), the relevant inflation pressures will be agreed between vehicle and tyre manufacturers (or their national associations), taking into consideration the vehicle characteristics and the type of service.

For **ZR tyres** without operational code the maximum load capacity given in the tables from page 20 onwards applies to speeds up to 240 km/h (150 mph).

For speeds over 240 km/h (150 mph) please refer to us for load capacity and tyre pressure.

If car tyres are to be used on a vehicle with a **wheel camber** of over 2°, please check load capacity and tyre pressure with us. In the absence of such information, the following ETRTO recommendation can be used for tyres at speeds over 160 km/h (100 mph):

For a **wheel camber** exceeding **2° and up to and including 4°**, the load capacity is to be reduced linearly **from 100 % to 90 %.**

Instead of a reduction in tyre load capacity, **inflation pressure** may be **increased** as a function of load.

The tyre pressure calculated for the speed concerned must be multiplied by the following correction factor (f), irrespective of the actual camber angle > 2°:

$$f = \frac{1}{\left[1.0 - 0.01 \times (\text{allowance for the load capacity as a \%})\right]^{1.25}}$$

The value of f for the following camber angles is shown below:

Camber angle	2°	2.5°	3°	3.5°	4°
f	1.0	1.03	1.07	1.10	1.14

In general, the camber angle of vehicles should not exceed 4°.

On vehicles with speeds in excess of 270 km/h (169 mph), the camber angle should not exceed 3° including any tolerance.

The load capacity of tyres in **twin fitment** is 1.85 times the load capacity of a single tyre.

The **load capacities** in the tables for car tyres can be increased if the tyres are fitted on vehicles with **the following low type-related** max. speeds if the inflation pressure is increased at the same time (taken from the ETRTO Standards Manual).

Max. speed capability	(km/h)	60	50	40	30	25
Load capacity	(%)	110	115	125	135	142
Inflation pressure increase	(bar)	0.1	0.2	0.3	0.4	0.5

Tyre damage

Most tyre damage is caused by incorrect tyre pressure, so we recommend a regular tyre pressure check every 2 weeks. When the car has been driven and the tyres are warm, it is normal for the **tyre pressure to increase.** Do not reduce extra pressure caused by a heat build-up.

A balanced, even **style of driving** is beneficial for the tyres and the environment. Harsh acceleration, braking with locked wheels and fast steering movements shorten the **service life** of tyres.

This applies equally to other types of **tyre strain** such as severe scuffing along the kerb, or driving over rough surfaces. This can cause hidden or visible **damage** to tyres.

Sudden **vibrations** of the steering wheel could point to tyre damage. All the vehicle's tyres should be checked immediately for damage.

Overstressing of tyres (excessive speed or overloading), is to be avoided. This has the same critical effect as **under-inflation** and can cause heat damage to the tyre.

Tyre Rotation on a vehicle

The tyres on a vehicle should be rotated regularly to help ensure even wear and maximum tread life. Tyres should be rotated as instructed in the vehicle owner's manual, with special attention being given to the **recommended interval for rotating tyres.** Unless otherwise specified by the vehicle manufacturer, tyres should be rotated every 10.000 to 12.000 kilometers – or even earlier if the tread shows signs of uneven wear. In the latter case, the vehicle's wheel alignment and pertinent mechanical components should be checked and corrected, if need be.

Full-size **spare tyres** (not temporary spares) of the same size and design as the tyres in use on the vehicle should be included in the tyre rotation. In conjunction with the rotation, the full-size spare tyre's inflation pressure should be checked and, if need be, corrected.

A tyre's **inflation pressure** must correspond to what is specified in the vehicle owner's manual for the respective tyre position (recommended inflation pressure may differ for the front- and rear-axle tyres).

Tyre rotation may effect the **tyre pressure monitoring system** (TPMS). The vehicle owner's manual or a qualified service professional should be consulted in the event that the TPMS has to be adjusted or recalibrated.

The **rolling direction** of directional tyres should not be reversed when the tyres are rotated.

Mixing tyres should be avoided

Tyre size, Load Index (LI) and Speed Index (SI) at all wheel positions should be in accordance with the vehicle manufacturer's specification. In many countries, this is a legal requirement.

Driving with a non-recommended mix of tyre sizes, designs and Speed Indices can be dangerous. In the event that tyres of different sizes, designs, Load or Speed Index are to be fitted on a vehicle, the vehicle manufacturer's recommendations should be heeded and/or the advice of a qualified tyre specialist sought. Some vehicles leave the factory with different tyre sizes on the front and rear axles. This configuration must not be changed unless approved by the vehicle manufacturer.

No more than one temporary spare should be used on a vehicle at any one time. A tyre of this kind should only be used at a certain speed and for a certain distance, as indicated on the tyre sidewall and/or on a label attached to the tyre or the wheel.

Mounting new tyres on the rear axle

It is recommended that all tyres used on the vehicle be replaced at the same time. If this is not the case, at least all the tyres on the same axle should be replaced at the same time.

If only one axle set of tyres is replaced, it is recommended to fit the newest tyres on the rear axle. This may complicate tyre rotation and caution is advised if the tyres differ in terms of state of wear, size, design and Speed Index, for example. In this case it is strongly recommended that a trained tyre specialist be consulted.

The point of the above mounting recommendation is to increase traction on the rear axle. This is important in avoiding oversteer and loss of vehicle stability on slippery surfaces.

Additional important tips regarding tyre position

The **spare tyre's** date of manufacture and condition (e.g. signs of cracking, remaining tread depth) should be checked regularly. The spare tyre may have to be replaced.

For 4-wheel drive and All Wheel drive vehicles, any special tyre fitment requirements in the vehicle owner's manual should be heeded – especially if the vehicle is equipped with electronic systems such as antilock brakes, traction control or stability control. Damage to the vehicle or its transmission can result if these requirements are not followed.

Winter tyres should be fitted to all wheel positions. They should not be mixed with all-season or summer tyres. If winter tyres are, nonetheless, mounted on just one axle, this should be the rear axle. This increases rear-axle traction and helps to avoid oversteer and loss of vehicle stability on slippery roads.

Tyre Storage Recommendations

These recommendations are intended for consumers, but they are also important for tyre dealers. For commercial applications of new and waste tyres (tyre dealers and fleets), there may be more stringent and legal restrictions. Please check local regulations.
Tyres are compounded to resist normal deterioration caused e.g. by sunlight, humidity and ozone. Nevertheless, stored tyres should be protected against these and other potentially damaging conditions.

The longer the storage period, the more exposure there is to potential damage.

After dismounting from a vehicle the tyres should be thoroughly cleaned and inspected for damage. Remove all stones and debris from the grooves. Chalk marking the tyres with their wheel positions (FL for Front Left, RR for Rear Right, etc.) will help to find the correct positions according the rotational plan.

General:

- DO STORE TYRES where it is clean, dark, dry and moderately ventilated.
- **Moist conditions** should be avoided. Tyres destined for retreading/repairing should be thoroughly cleaned and dried out before such operations are performed.
- DO STORE TYRES at **temperatures** not exceeding 35° C (95 F), preferable below 25° C (77 F). Direct contact with hot pipes and radiators must be avoided.
- Also deeply cold temperatures, those well below the freezing point, might lead to brittleness and tyres should be carefully warmed up before use.
- DO STORE TYRES, if outdoors, protected by an opaque waterproof covering, but avoid creating a heat box or steam bath. Ensure proper ventilation.
- DO STORE TYRES, if outdoors, where tyres are raised off the storage surface.
- **AVOID** STORING TYRES on piers, ship decks, or other unprotected areas
- **AVOID** STORING TYRES, where they can be damaged by passing objects – lawn mower, bicycle, or garden tools.
- **AVOID** STORING TYRES where the area is wet, oily, and/or greasy such as with gasoline or petroleum-based products. Also, do not store on or against sensitive surfaces where staining can take place.
- **AVOID** STORING TYRES in the proximity of chemical agents like solvents, fuels, oils, hydrocarbons, paint, acids, disinfectants, etc.
- **AVOID** STORING TYRES where subject to extreme temperatures, direct sunlight or artificial light with a high ultra-violet content. Room lighting with ordinary incandescent lamps is preferable to fluorescent tubes.
  Never store them near battery chargers, ovens, or open fires.
- **AVOID** STORING TYRES on black asphalt or other heat absorbent surfaces and on highly reflective surfaces (i.e., sand or snow covered ground)
- **AVOID** STORING TYRES in the same area as an electric motor or other ozone generating source. If there is a question, check ozone levels to be sure they do not exceed 0.08 ppm.
- **Do not** use tyres as a workbench or tool stand. Soldering irons, power drill and tools can damage a tyre. **Never** put a burning cigarette on a pile of tyres.
- **Do not** store other items on top of a tyre, especially where staining of the surface would be a concern.

Loose tyres or tyres mounted on rims, but not installed on a vehicle:

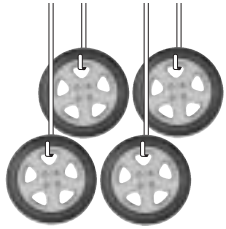
- DO STORE TYRES so that tyres retain their shape.
- Mounted tyres should preferable be inflated to only 100 kPa (15 psi / 1 bar).
- **Be sure to adjust the tyres to the recommended inflation pressure before mounting on the vehicle.**

Tyres installed on a vehicle in long term storage:

- If possible, store the vehicle on blocks to remove all weight from the tyres and cover the tyres to protect them from environmental exposure.

Tyres with rims

Inflated



Do not stand them upright

hang them

or pile them (restack every four weeks)

Tyres without rims

Do not pile them, or hang them

stand them upright and rotate them every four weeks (on racks clear of floor)

- If the vehicle cannot be blocked up from the storage surface, completely unload the vehicle, so minimum weight will rest on the tyres. The storage surface should be firm, reasonably level, well drained, and clean.
- In cases where the tyres will be supporting the vehicle, it is permissible to inflate the tyres to the maximum pressure listed on the sidewall. Be sure to return the inflation pressure to recommended usage pressure before operating the vehicle.
- In cases where the tyres will be supporting the vehicle, it is recommended that the vehicle be moved every month to minimize ozone cracking in the bulge area and also to minimize a “flat spot” from developing. If the tyres do develop “flat spots,” this will usually disappear in a short period of service.

Before Returning Tyres (including full-size spares) to Service

- Inspect tyres to be sure they are clean and free from foreign objects.
- Remove any water that has collected in an unmounted tyre.
- When using a spare tyre, have it checked for proper inflation pressure and condition such as cracking in the tread or sidewalls, weather checking, and other signs of prolonged storage by a full-service tyre dealer, before placing it in service on the vehicle.

Full-Size Spare Tyres

Full-size spares, of the same size and type as the road tyre, require special maintenance considerations.

The spare tyre position on the vehicle is frequently not suitable for long term storage for full-size spare tyres that are not properly maintained / rotated as recommended. Tyres contain special ingredients such as waxes, etc. to protect the rubber. These special tyre ingredients normally migrate throughout the tyre when in service and protect the tyre against deterioration caused e.g. by sunlight, humidity and ozone.

Therefore, full-size spares that are left for prolonged periods of time in the spare tyre position should be inspected, properly inflated just like road tyres, and included in the regular tyre rotation.

Tyre repair

SAFETY WARNING!

Serious injury or death may result from a tyre disablement that is caused by failing to observe the following safety and maintenance information.

During its service life, a tyre undergoes a variety of different usage conditions and can be damaged in many different ways. This damage can result from punctures, impacts, cuts, etc. Tyre damage can reduce a tyre's structural integrity by, for example:

- Air loss resulting in underinflated service conditions which lead to internal structural damage;
- Direct damage to tyre components such as rubber and plies;
- Exposure of internal materials to the outside environment and resulting degradation; and/or
- Exposure of internal materials to pressurized air (Intra-carcass pressurization).

For these reasons, tyres should be regularly inspected by the consumer. An inspection of the tyres should also be incorporated during routine vehicle maintenance procedures. If tyre damage is suspected or found, it should be carefully assessed by a trained specialist immediately.

A consumer should never repair a damaged tyre. Only a trained tyre specialist who can base his assessment on a thorough and comprehensive inspection of the specific tyre can determine whether an individual tyre is suitable for repair or should be removed from service. This assessment should also take into account the complete service life history of the tyre including inflation, load, operating conditions, etc. If the tyre specialist decides to repair the tyre, then he should strictly follow all appropriate national tyre industry repair standards regarding the inspection process and repair procedures. Barum is not responsible for the specialist's decisions or the repaired tyre. Barum advises if a tyre is returned under complaint and reason for the product's disablement is in any way associated with a repair or the reason for repair the manufacturer's warranty is invalidated.

It is forbidden by law to regroove car tyres.

Tyre service life for passenger car and light truck

The tyre industry has long recognized the consumers' role in the regular care and maintenance of their tyres. The point at which a tyre is replaced is a decision for which the owner of the tyre is responsible. The tyre owner should consider factors to include service conditions, maintenance history, storage conditions, visual inspections, and dynamic performance. The consumer should consult a tyre service professional with any questions about tyre service life.

The following information and recommendations are made to aid in assessing the point of maximum service life.

Tyres are designed and built to provide many thousands of miles of excellent service. For maximum benefit, tyres must be maintained properly to avoid tyre damage and abuse that may result in tyre disablement. The service life of a tyre is a cumulative function of the storage, stowing, rotation and service conditions, which a tyre is subjected to throughout its life (load, speed, inflation pressure, road hazard injury, etc.). Since service conditions vary widely, accurately predicting the service life of any specific tyre in chronological time is not possible.

The consumer plays an important role in tyre maintenance.

Tyres should be removed from service for numerous reasons, including tread worn down to minimum depth, damage or abuse (punctures, cuts, impacts, cracks, bulges, underinflation, overloading, etc). For these reasons tyres, including spares, must be inspected routinely, i. e., at least once a

month. Regular inspection becomes particularly important the longer a tyre is kept in service. If tyre damage is suspected or found, Barum recommends that the consumer have the tyre inspected by a tyre service professional. Consumers should use this consultation to determine if the tyres can continue in service. It is recommended that spare tyres be inspected at the same time. This routine inspection should occur whether or not the vehicle is equipped with a tyre pressure monitoring system (TPMS).

Consumers are strongly encouraged to be aware of their tyres' visual condition. Also, they should be alert for any change in dynamic performance such as increased air loss, noise or vibration.

Such changes could be an indicator that one or more of the tyres should be immediately removed from service to prevent a tyre disablement.
Also, the consumer should be the first to recognize a severe in-service impact to a tyre and to ensure that the tyre is inspected immediately thereafter.

Tyre storage, stowage and rotation are also important to the service life of the tyre. More information regarding proper storage, stowage and rotation is located in other Barum publications, which are available upon request and through its websites.

Tyre service life recommendation

Barum is unaware of any technical data that supports a specific tyre age for removal from service. However, as with other members of the tyre and automotive industries, Barum recommends that all tyres (including spare tyres) that were manufactured more than ten (10) years previous[1)] be replaced with new tyres, even when tyres appear to be usable from their external appearance and if the tread depth may have not reached the minimum wear out depth. Vehicle manufacturers may recommend a different chronological age at which a tyre should be replaced based on their understanding of the specific vehicle application; Barum recommends that any such instruction be followed. Consumers should note that most tyres would have to be removed for tread wear-out or other causes before any proscribed removal period. A stated removal period in no way reduces the consumer's responsibility to replace tyres as needed.

Minimum removal tread depth for passenger and light truck tyres

1.6 mm is the most widely accepted minimum tread depth standard at which tyres should be removed from service. This standard has been adopted as a regulation by many of the world's national transportation authorities. As an indication to the consumer, there are tread wear indicator bars in the main grooves of the tyre that become level with the tread surface at approximately 1.6 mm of remaining tread (see page 5)..

In addition to acknowledging the above, **Barum recommends** that all passenger and light truck tyres in highway motor vehicle application be removed from service at the following tread depths:

- **summer/high performance tyres = 3 mm**
- **winter tyres = 4 mm**

These recommendations are based upon Barum's testing as well as real world experience which shows that drivers can maintain the performance potential (e.g. wet grip) of their tyres by replacing them before they reach the **regulatory minimum tread depth of 1.6 mm.**

This applies especially to winter tyres for which winter driving properties such as snow traction are significantly reduced at tread depths below 4 mm.

[1)] Production code of tyres see page 5.

Guidelines on tyre safety for drivers and vehicle operators (recommended for vehicle handbooks).

Tyres need to be properly handled if they are to keep you and other road users safe. So please note the following:

1. The **tyre pressure** must be as indicated in the operating instructions for your vehicle or as marked on the vehicle itself. The pressure applies to cold tyres; it must not be any lower. Tyres that have become warm, e.g. through driving, will increase in pressure. Never release air from warm tyres, or the pressure could fall below the minimum.

   The pressure must be checked **every 14 days** when the tyres are cold. Don't forget to check the spare.

   If the pressure is too low, heat may build up in the tyre and lead to internal damage. **At high speeds the tread may even come off and the tyre may have a blowout.** Tyre damage that cannot be seen is not put right simply by raising the pressure afterwards!

2. Drive over **kerbstones** slowly and, if possible, at right angles. Don't drive up or against any steep or sharp-edged kerbstones or other objects (e.g. stones); this can lead to non-visible tyre damage which can cause problems later – **the tyre may fail when running at high speeds.**

3. Check tyres regularly for **damage,** such as stones, nails etc. that have penetrated the tyre, as well as any cuts, tears or bulges (in the sidewall). Foreign objects can also damage the inside of the tyre. Let your tyre dealer or specialist check to see if the tyre can be repaired. If a repair is not possible or doubtful, replace the tyre. **Damaged tyres can burst.**

4. Never fit used tyres whose 'life story' you don't know. And remember that **tyres age** even when they are little used or not used at all. If your spare tyre remains unused for years, you should only use it in emergencies and drive carefully.

5. Check the **tread depth** of your tyres regularly. The lower the depth, the greater the **risk of aquaplaning.** Ensure that your tyres comply with the legally required tread depth.

Footnotes for technical data

1) Instead of J-rims the same size JK- and JJ-rims may be used.

2) Winter tyres can be max. 1 % greater in outer diameter than standard on-road tread patterns.

3) At 37 mph / 60 km/h (measuring speed).

4) Load Index single / twin fitment and Speed Index.

5) Rim sizes in bold type: measuring rim.

6) Standard = on road tread pattern,
Special = M + S or off-road tread pattern.

7) S = Single / T = twin fitment.

*) Suitable for stud application.

**) Studded winter tyre. Not permitted for use in countries with a ban on studded tyres. Not available in the UK.

***) 80 series car tyres can be used instead of 82 series tyres and vice versa, without amending the entry in the vehicle registration document. Prerequisite: LI (Load Index) and SI (Speed Index) must be equivalent in value (or higher) and meet the requirements of the vehicle documents.

➜ in preparation.

❑ being phased out.

For tyre pressures see “Operating instructions”, p. 43 ff.
